

QUERY/RESPONSE VALIDATION Complete Level

2022

56 of 61 (92%) IIS were connected with the testing process and measured.

20 of 56 (36%) connected IIS were Validated at the complete level for Query/Response.

Validated	Major Differences
Not Measured	Opted out

The American Immunization Registry Association (AIRA) launched its community-driven immunization information system (IIS) Measurement and Improvement Initiative in mid-2015, with the dual goals of providing IIS with information to more fully align with IIS Functional Standards, while also developing a summary of where IIS are as an overall network in meeting standards and best practices. This report shares the results of IIS that have been measured in Validation as the third stage of the voluntary, phased Measurement and Improvement process.

Introduction

Measurement and Improvement

The American Immunization Registry Association (AIRA) launched its community-driven immunization information system (IIS) Measurement and Improvement Initiative in mid-2015, with the dual goals of providing IIS with information to more fully align with IIS Functional Standards, while also developing a summary of where IIS are as an overall network in meeting standards and best practices. The initiative connects AIRA testing processes with IIS pre-production (or test) systems and shares actionable results with IIS. AIRA is continuing to connect and test with a growing number of IIS interfaces, with more than ninety-five percent (95%) of the IIS community's pre-production systems currently connected. The data available are helping to guide individual IIS enhancements to align with standards, and the AIRA Measurement for Assessment and Certification Advisory Workgroup (MACAW) is seeing significant improvements in interoperability between IIS and electronic health record (EHR) systems across the community.

This report shares the results of IIS that have been measured in Validation as the third stage of the voluntary, phased Measurement and Improvement process for IIS measurement. This stage recognizes those IIS aligning with standards while also acknowledging IIS progressing toward meeting standards. Query/Response was the third content area to move into Validation.

The following table presents the phased schedule for Measurement and Improvement, with emphasis on this current report on Query/Response Validation.

		Stages		
		Testing and Discovery Stage	Assessment Stage	Validation Stage
Content Area	Transport	→		
	Submission/ACK	→		
	Query/Response	→		
	CDS	→		
	Data Quality (6)	→		
	Functions			
	Policy			
	Security			

Query/Response

The IIS Assessment process utilizes the National Institute of Standards and Technology (NIST) Immunization Test Suite Validation Tool.¹ This tool provides consistent conformance-based results for all measured IIS. In addition, the technical requirements for

¹ <https://hl7v2-iz-r1.5-testing.nist.gov/iztool/#/home>

Query/Response are documented in the *HL7 Version 2.5.1: Implementation Guide for Immunization Messaging, Release 1.5*² and addendum.³ This is referred to as the “National IG” in the remainder of this document.

This report provides results for the **complete** level of Query/Response Validation; results for the **basic** level can be found [here](#).

Summary information is presented for all measured IIS; individual results are available to authorized users in the [Aggregate Analysis Reporting Tool \(AART\)](#). An [overview document](#) is available that details the entire Measurement and Improvement Initiative.

Methods

AIRA technical staff are responsible for implementing and conducting all testing efforts within the Measurement and Improvement Initiative. Current test methodology involves connecting with IIS pre-production systems through a web services interface, submitting test messages, and receiving back and analyzing test results.

All measures and tests are developed by [MACAW](#). Before 2021, measures required AIRA Board of Directors’ approval, and therefore Query/Response Assessment and Validation measures were approved under that structure in December 2016 and March 2018, respectively. Measures and tests are based on the CDC’s [IIS Functional Standards](#). For Query/Response, the Functional Standards and Operational Guidance Statements referenced include:

FS 1.0: The IIS contains complete and timely demographic and immunization data for children, adolescents and adults residing or immunized within its jurisdiction.

OGS 1.5: The IIS ensures that submitted vaccination and demographic data are processed and viewable in a timely manner.

OGS 1.6: The IIS assures the receipt, processing and storage of demographic and vaccination data elements as endorsed by the CDC.

FS 8.0: The IIS exchanges data with health information systems in accordance with current interoperability standards endorsed by CDC for message content, format, and transport.

OGS 8.3: The IIS receives queries from, and sends responses to, health information systems consistent with the current CDC endorsed HL7 Implementation Guide.

The Validation stage uses the same (or a subset of) measures and tests that have been developed, vetted, and approved by the IIS community for IIS Assessment. Measures for each content area of Validation will be drawn from published IIS Assessment measures and

² <https://www.cdc.gov/vaccines/programs/iis/technical-guidance/downloads/hl7guide-1-5-2014-11.pdf>

³ <https://www.cdc.gov/vaccines/programs/iis/technical-guidance/downloads/hl7guide-addendum-7-2015.pdf>

tests. No new measures or tests will be introduced in the Validation stage that are not already measured and visible in the Assessment stage.

Validation reports are run quarterly, and an IIS can achieve Validation status during any quarter of the year. Once achieved, Validation is considered “active” for the calendar year. Validation will be retested and renewed in the first quarter of each subsequent calendar year.

Measures

Validation is measured at two levels: basic and complete. The **complete** level of Query/Response Validation contains seven measures (measures 1-4, and 6-8 of Assessment measures):

1. The IIS processes a query requesting a patient’s immunization record.
2. The IIS processes a query requesting a patient’s evaluated immunization record and forecast.
3. The IIS responds to a query for a known patient (one-to-one match).
4. The IIS responds to a query for a patient that is not in the IIS.
6. The IIS responds to a query that has a significant error that cannot be accepted.
7. The IIS responds to a query for a known patient and returns known Core Data Elements.
8. The IIS responds to a query with an RSP within 5 seconds or less for 95% of the queries submitted.

The **basic** level report is also available by request. Visit the [AIRA repository](#) for more detailed information about [Query/Response measures and tests](#).

Results

Below are results for Query/Response Validation for 2022. Unless an IIS declares otherwise, the functionality tested in pre-production is presumed to be available to end users in production.

One additional IIS was not able to be measured at this time, while four opted not to be measured in Query/Response Validation. Validation reports are run quarterly, and an IIS can achieve Validation status during any quarter of the year. Once achieved, Validation is considered “active” for the calendar year. Validation will be retested and renewed in the first quarter of each subsequent calendar year.

Below are results for Query/Response Validation for 2022 in tabular form.

Table: Query/Response Validation, Complete Level 2022

Validation Status and Definition	IIS
Validated: The IIS must meet Measures 1-4 and 6-8.	Arkansas, Connecticut, Delaware, Guam, Illinois, Kansas, Kentucky, Missouri, Nevada, New Hampshire, New Mexico, Oklahoma, Philadelphia, South Carolina, Virgin Islands
Validated with Minor Differences: The IIS deviates in 1 or more measures.	American Samoa, Marshall Islands, Micronesia, N. Mariana Islands (CNMI), Palau
Major Differences: The IIS does not meet 1 or more measures specified above.	Alabama, Alaska, Arizona, California, Colorado, District of Columbia, Georgia, Hawaii, Idaho, Indiana, Iowa, Louisiana, Maine, Maryland, Massachusetts, Minnesota, Mississippi, Montana, Nebraska, New Jersey, New York City, North Carolina, Ohio, Oregon, Pennsylvania, Puerto Rico, Rhode Island, South Dakota, Tennessee, Texas, Utah, Virginia, Washington, West Virginia, Wisconsin, Wyoming
Not Measured: The IIS is not able to be tested at this time.	Michigan
Opted Out: The IIS has chosen not to be measured.	Florida, New York State, North Dakota, Vermont

Conclusion

Many IIS are continuing to implement functionality to fully conform with the IIS Functional Standards, particularly as it relates to full implementation of HL7 2.5.1, release 1.5. These results suggest that IIS have improvements to make, particularly around full conformance with the response message format. In many cases, the IIS’s query functionality may be operational, but both the IIS and EHRs may be interfacing in non-standard ways. Published

Validation reports offer transparency into the progress IIS are making to come into full alignment with our community-driven standards. AIRA staff are also available to provide technical assistance to IIS programs and vendors as requested.

Please visit AIRA's [website](#) for more background or other information on the Measurement and Improvement Initiative. Contact AIRA with questions at aart@immregistries.org.

Appendix A: Glossary of Terms and Acronyms

AART: The Aggregate Analysis Reporting Tool, an application used to display and share results from the Measurement and Improvement process.

Assessment Stage: A more formal testing step to measure IIS systems using IIS community-selected measures and tests, to share those results for quality improvement, and to provide technical assistance to accelerate improvement. This is the second of 3 stages.

Basic Level: A level of Validation measurement that includes only essential measures to functionally meet this content area.

Complete Level: A level of Validation measurement that includes conformance to all measures approved for Validation.

Content Area: A category for measuring IIS functionality and capability within a specific functional area, made up of distinct measures and tests. Measures and tests will become more formalized as they progress into different stages.

MACAW: Measurement for Assessment and Certification Advisory Workgroup.

Major Differences Status: The IIS cannot support the measures because of additional requirements that conflict with the national standard; the IIS must make significant changes in 1 or more measures to align with standards.

Measure: A metric developed to measure how well an IIS aligns with IIS Functional Standards/Operational Guidance Statements or other recognized standard.

Stage: A distinct period of testing in the measurement and improvement process.

Testing and Discovery Stage: A step in testing IIS systems to gather preliminary and general information on community alignment with standards. Testing and Discovery precedes all stages.

Validated Status: The IIS has achieved full alignment with community-selected measures.

Validated with Minor Differences Status: The IIS has achieved full alignment with community-selected measures except for differences that (1) are allowed by the standard (e.g., constraints) or (2) are meeting requirements of local policy/law that do not conflict with standard requirements.

Validation Stage: A summary step to acknowledge IIS that are progressing toward or achieving alignment with community-selected measures and tests. A Validation designation is automatically achieved when an IIS meets the designated measures and tests in a specific content area (e.g., Transport, Submission/Acknowledgment, Query/Response, etc.).

Appendix B: Planned Stages and Content Areas of Measurement

The stages and content areas of measurement were developed by MACAW. A stage is defined as a distinct level of testing in the Measurement and Improvement process. The stages of measurement are defined as follows:

Stage	Definition
Testing and Discovery Stage	An initial step in testing IIS systems to gather preliminary and general information on community alignment with standards. Testing and Discovery precedes all stages.
Assessment Stage	A more formal testing step to measure IIS systems using IIS community-selected measures and tests, to share those results for quality improvement, and to provide technical assistance to accelerate improvement. This is the second of three stages.
Validation Stage	A summary testing step to acknowledge IIS that are progressing toward or achieving alignment with community-selected measures and tests. A Validation designation is automatically achieved when an IIS meets the designated measures and tests in a specific content area (e.g., Transport, Submission/Acknowledgment, Query/Response, etc.), but interim steps toward Validation are also recognized. Validation statuses include Validated, Validated with Minor Differences, Major Differences, Not Measured, and Opted Out. This is the third and final stage of measurement for each content area at this time.

Content areas for measuring IIS functionality and capability within a specific functional area are made up of distinct measures and tests. Measures and tests will become more formalized as they progress into different stages. The table below includes planned content areas for Assessment. The order may be subject to change.

Planned Content Area	Definition
Transport Messaging	Assessing alignment with standard protocols of SOAP/Web Services and specifications for the CDC WSDL for communications over a computer network.

Planned Content Area	Definition
Submission/ Acknowledgment Messaging	Assessing alignment with the Health Level Seven (HL7) 2.5.1 release 1.5 Implementation Guide and addendum for Immunization Messaging for Submission and Acknowledgement.
Query/ Response Messaging	Assessing alignment with the HL7 2.5.1 release 1.5 Implementation Guide and addendum for Immunization Messaging for Query and Response.
Clinical Decision Support	Assessing alignment with specifications for Clinical Decision Support for Immunizations, based on the Advisory Committee for Immunization Practices.
Data Quality – tentatively planned to include 6 topic areas	Assessing alignment with guidance and best practices from MIROW (Modeling of Immunization Registry Operations Workgroup) and AIRA Data Validation guides for testing new incoming ongoing data, and existing (data at rest) patient and immunization data via HL7 and User Interface entry for completeness, accuracy, and timeliness. Assessing completeness for enrollment and submission of provider organizations within a jurisdiction. Assessing completeness for demographic records for a patient population within a jurisdiction. Assessing the ability to detect unique and redundant patient and vaccination records and resolve appropriately in accordance with standards and best practices.
Functions	Assessing the availability of specific functionality or capacity within the program or the system, and its adherence to published standards or guidance (e.g., quality improvement initiatives).
Policy	Assessing the existence of policies and procedures that the program, or an individual in the program, is responsible for (e.g., a written disaster recovery plan).
Security	Assessing the existence of business rules or automated procedures that have been implemented to maintain the security of the system (e.g., ensuring data is backed up on a periodic basis).
