

Product Testing & Validation for IIS Technology Vendors

This one-pager outlines how immunization information systems (IIS) technology vendors participate in AIRA's Measurement and Improvement (M&I) initiative by testing their IIS products to align with national standards, tracking progress, and sharing results with the IIS community.

The M&I initiative is a voluntary, independent testing program to enhance data quality, interoperability, and overall system effectiveness of IIS.

- 1 Technology partner builds or enhances a base/modular IIS product and seeks to align with national standards.

- 2 The base/modular IIS product connects to AIRA's Aggregate Analysis Reporting Tool (AART) for testing in applicable content areas.

- 3 Review AART reports quarterly and receive actionable areas of improvements to meet national standards*

- 4 Share your product's progress in meeting national standards with the IIS community.

- 5 Participate in product Validation and share results in procurement responses and marketing materials.

*Participation in content areas can be updated at any time. Vendors can engage in continuous quality improvement by requesting AART reports as enhancements are implemented.
